In-situ diffraction

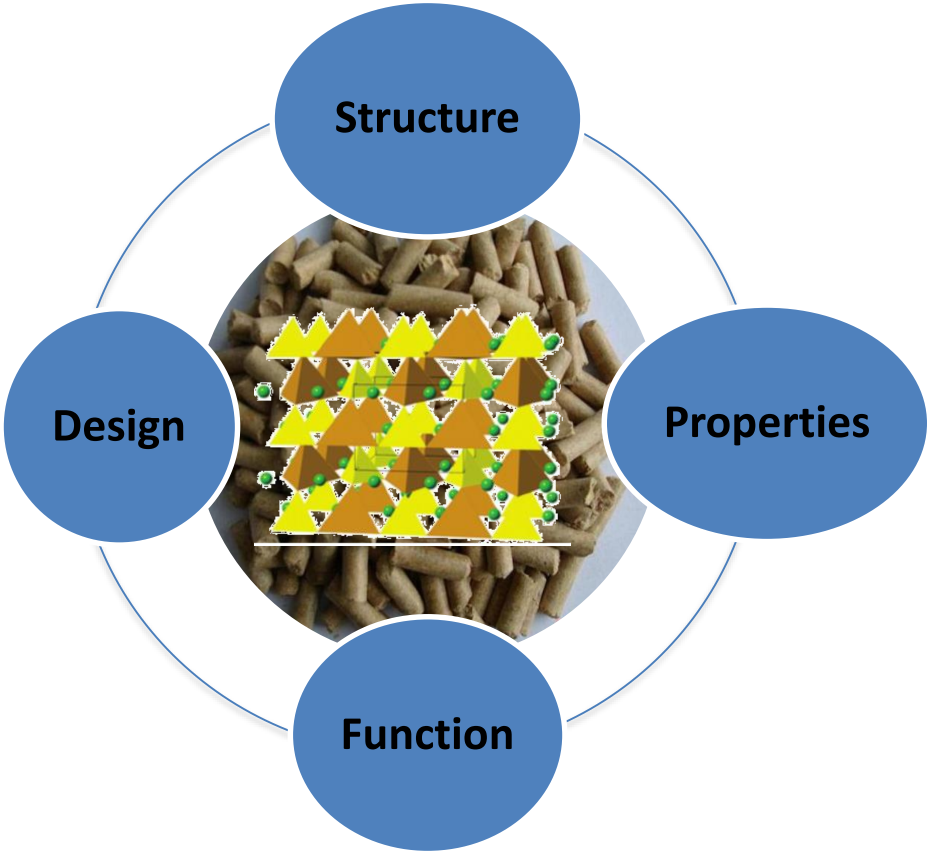
beatriz.moreno@lightsource.ca

Motivation for in-situ x-ray diffraction

Studying materials under working conditions:

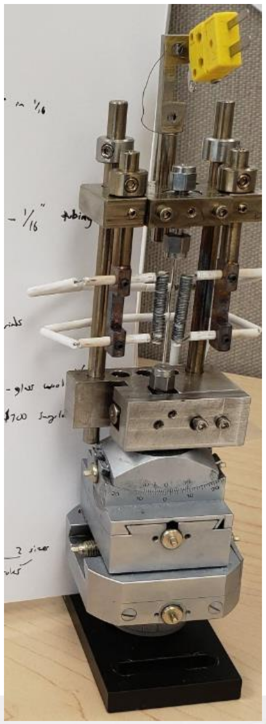
1. temperature
2. atmosphere
3. pressure
4. stress/strain
5. voltage/current
6. Light
7. …

Provides information on the chemical and physical properties of materials and devices under realistic processing conditions



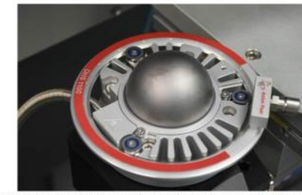
Applications: Microelectronics, batteries and fuel cells, catalysis, solar cells, materials under extreme conditions, etc.

Sample environments

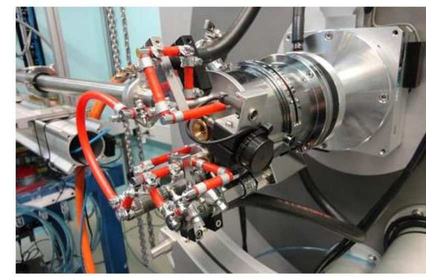


Sample environments seek to mimic the operation conditions of the materials or devices being tested

- Furnaces with controlled atmosphere and temperatur
- Tensile rigs
- Temperature/humidity light chambers
- in situ cycling / temperature control for battery studies
- Customized setups



The Anton Paar domed heating stage (DHS1100) can be used to heat flat plate samples from ambient temperature to 1100 °C in a variety of inert gas atmospheres or under vacuum.



A Stoe capillary furnace can heat capillaries up to 1770K. Quartz capillaries can be used up to 1370 K, above which sapphire capillaries must be used. Users must supply their own sapphire capillaries.

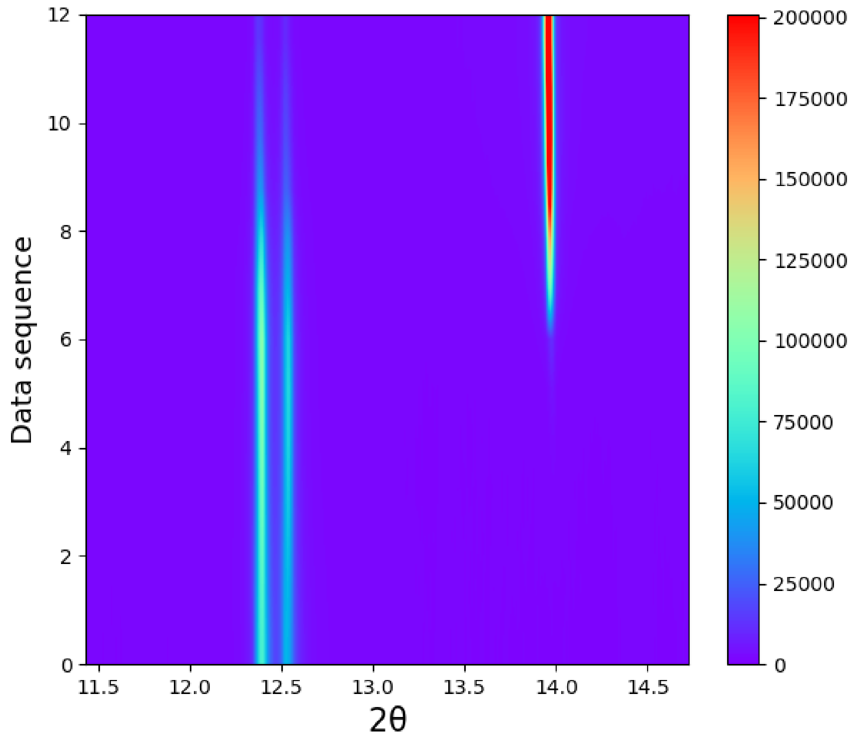
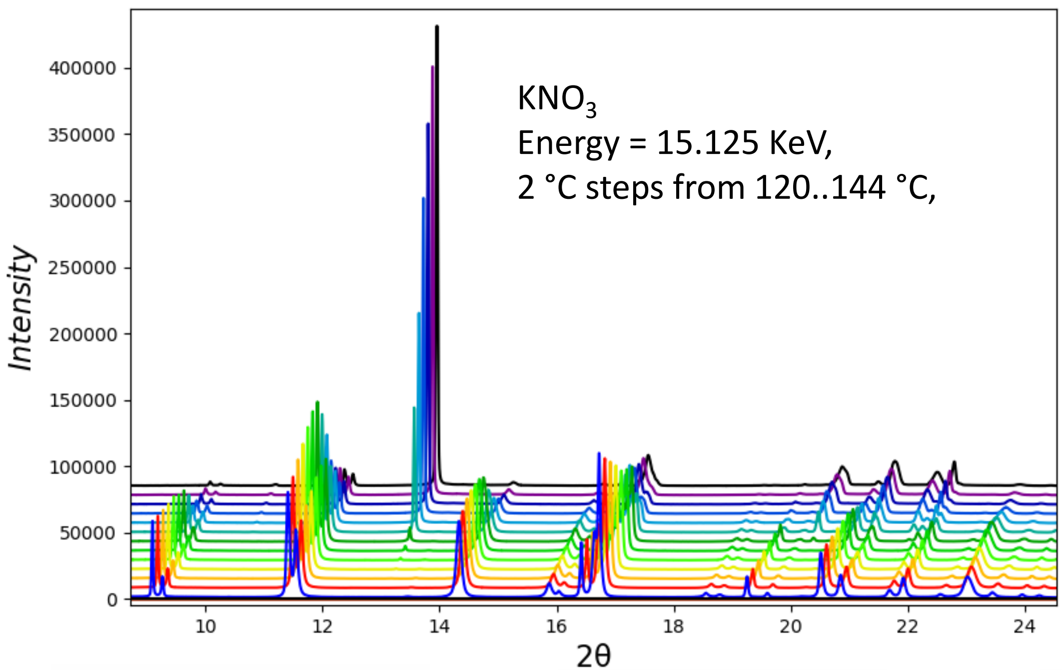
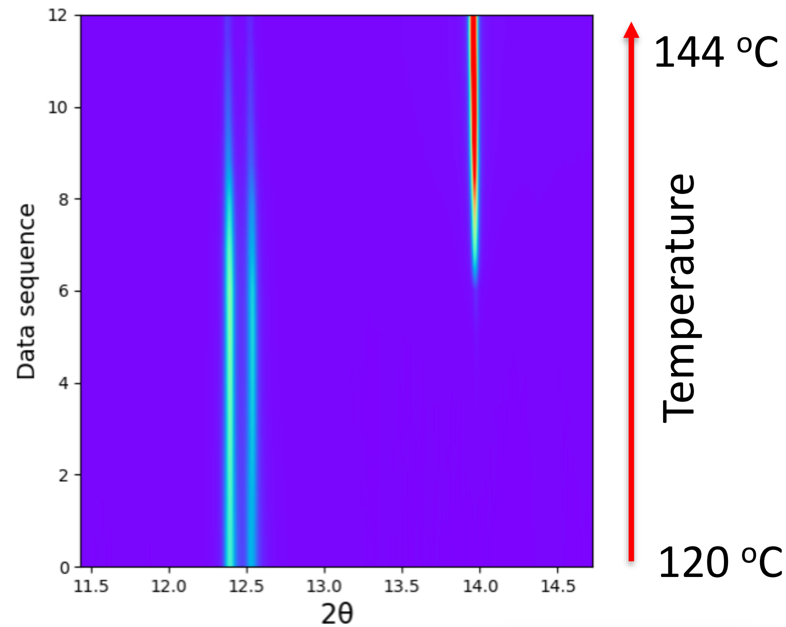
6. Catalysts
7. Corrosion
8. High pressure

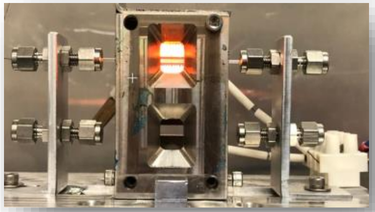


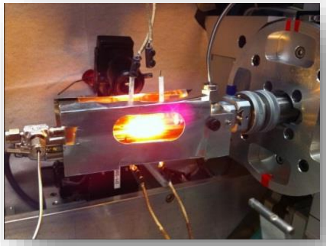
Applications – Structural phase transitions

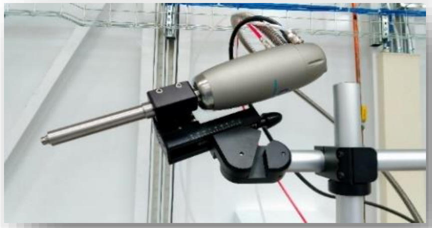
Orthorhombic $\alpha - KNO_3$ $\rightarrow$ trigonal β - KNO_3





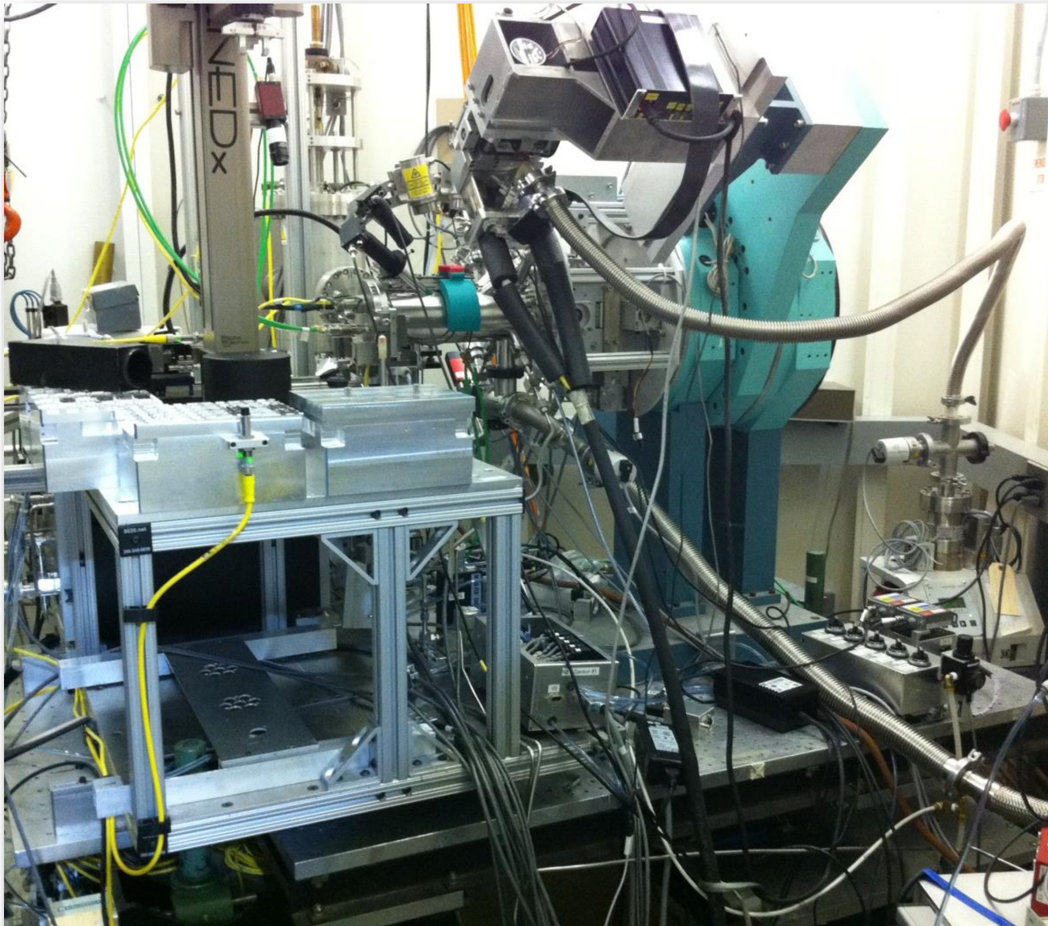






Applications to Microelectronics

IBM end-station



- **In-situ characterization**
  - thin films
  - microelectronic materials
  - semiconductors
- **Rapid thermal annealing (up to ~ 1100ºC)**

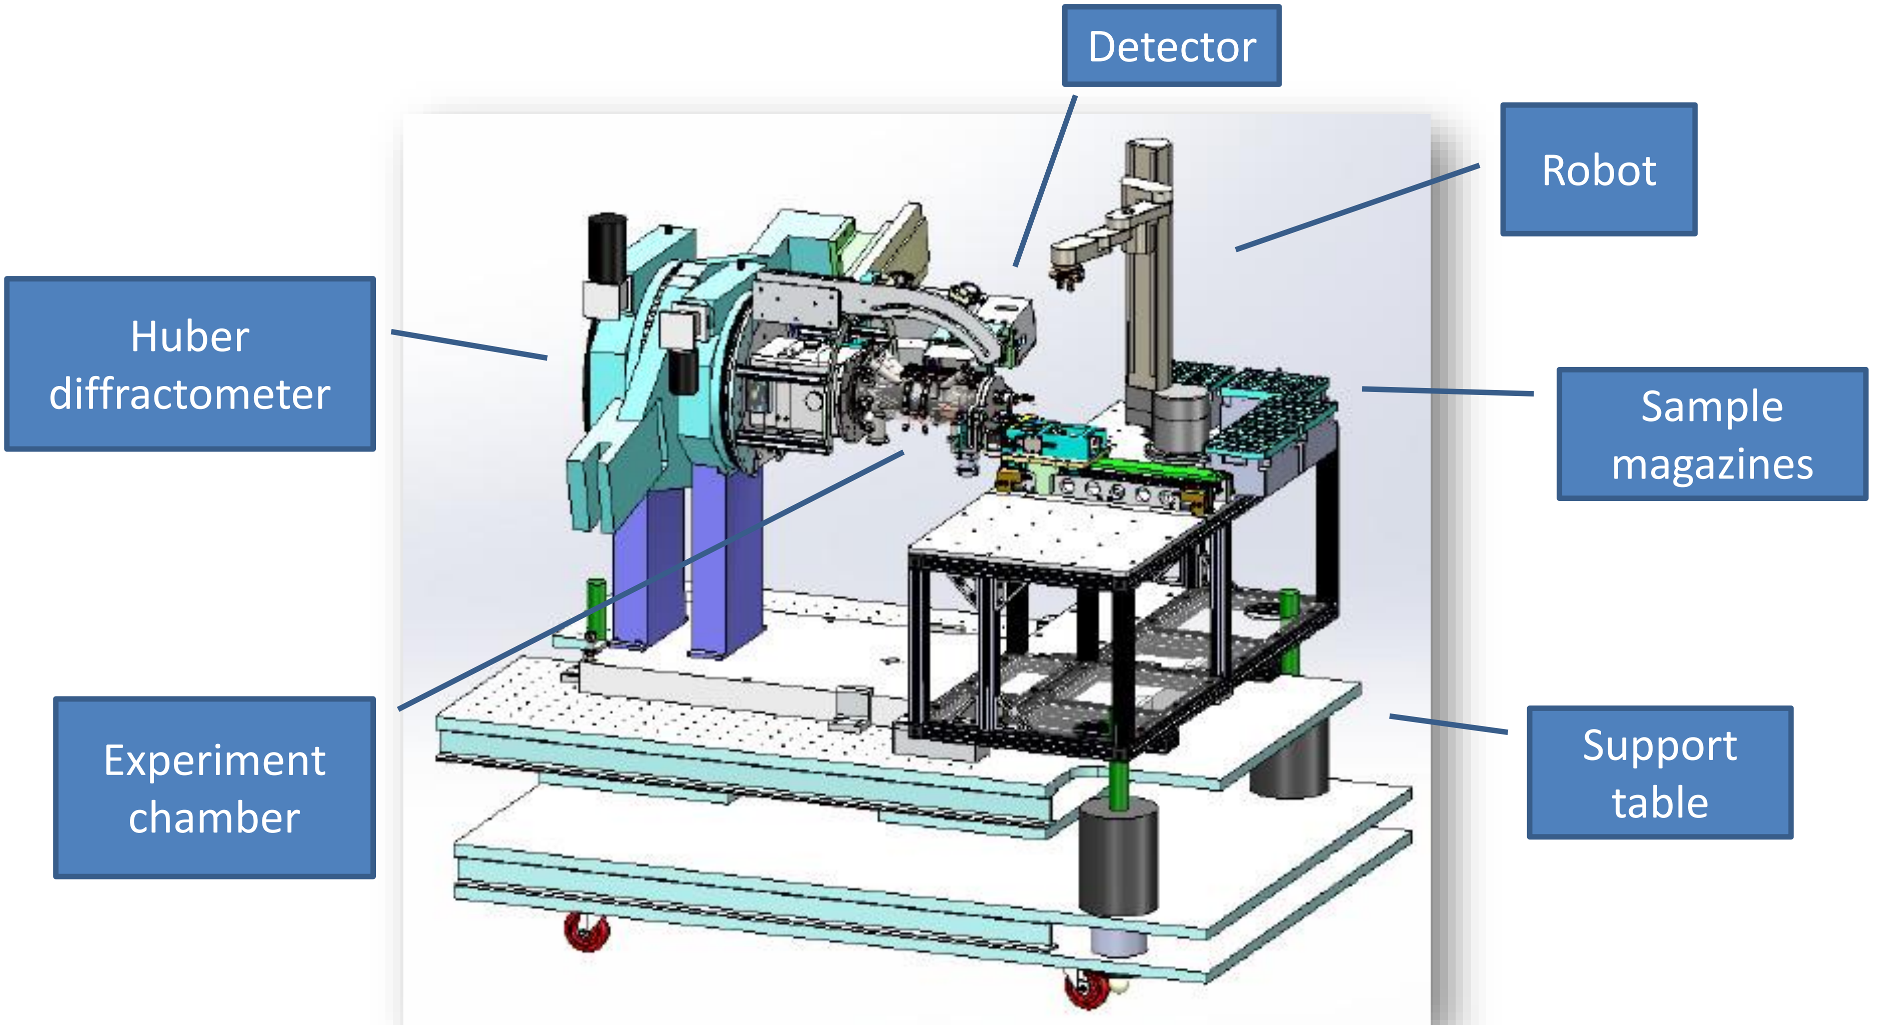
Techniques

✓ X-Ray diffraction

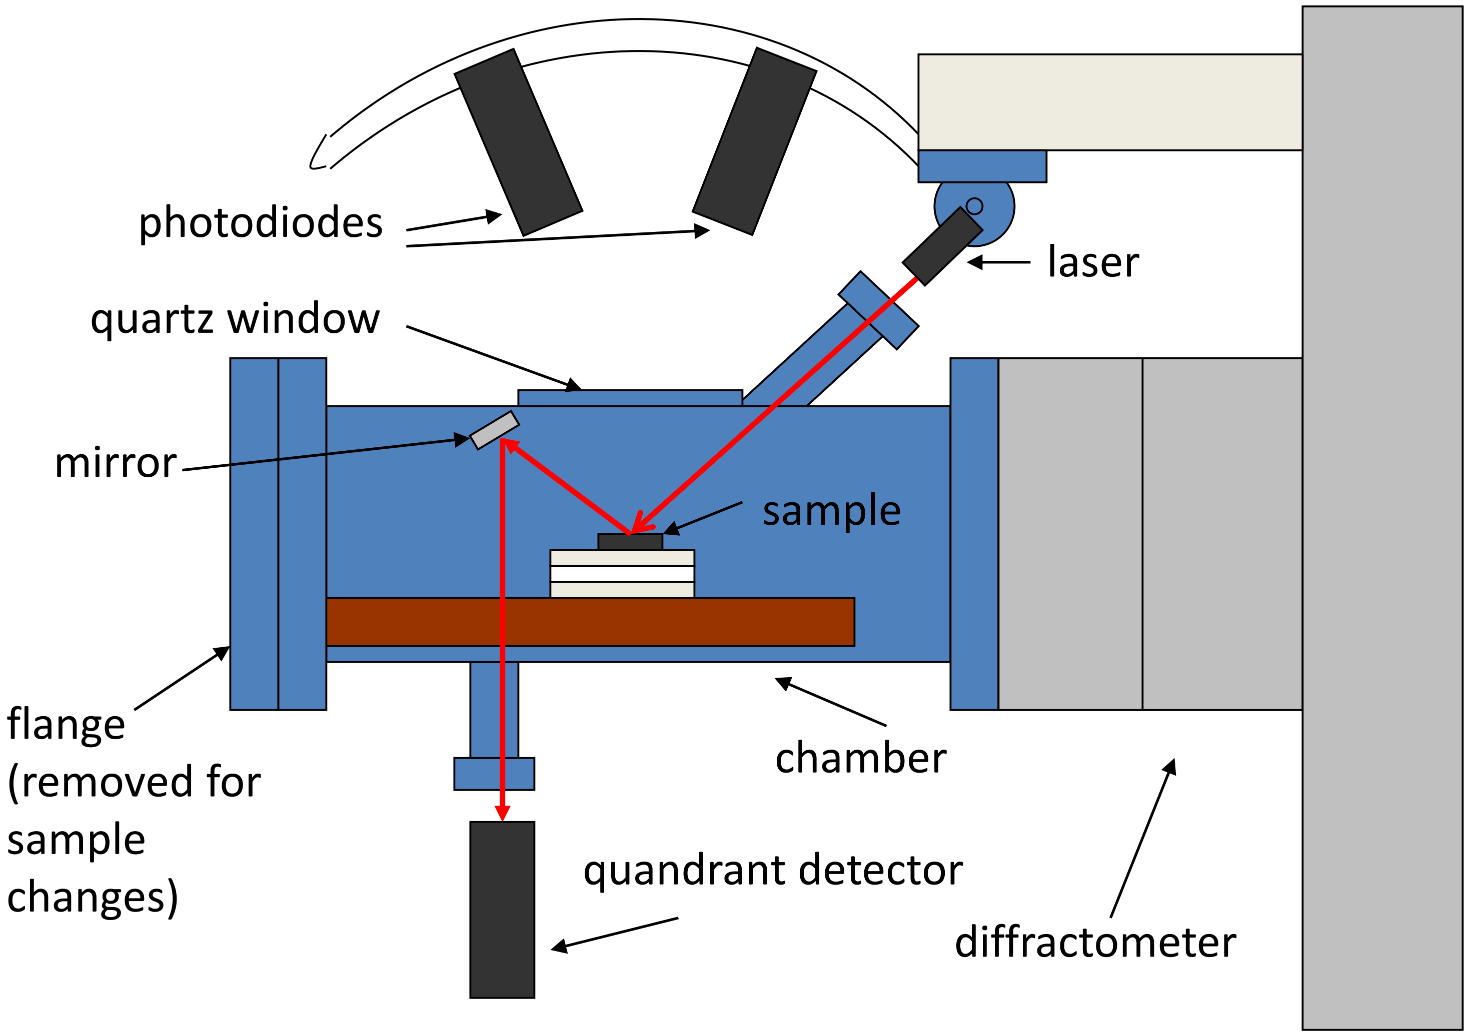
✓ Four point probe to measure film resistivity

✓ Optical light scattering to measure surface morphology

IBM end-station



Experiment chamber

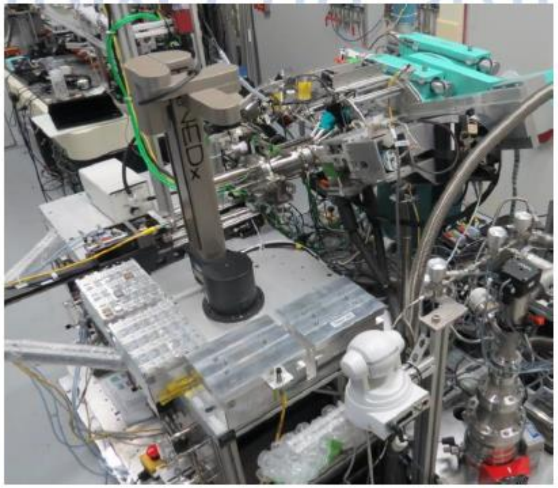


Sample size and format

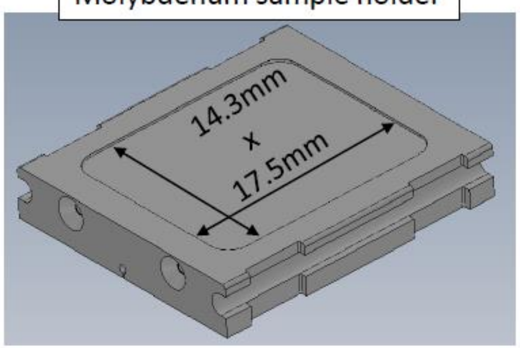
IBM end-station

Thin films studies

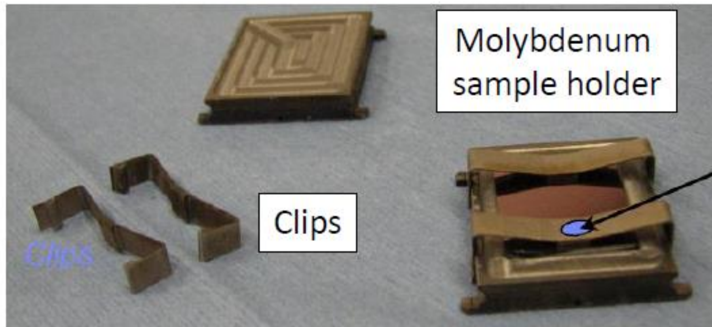
Combined diffraction,
resistivity and roughness measurements
under ultra high purity N_2 or He.
Temperature up to 1100 ºC.



Molybdenum sample holder

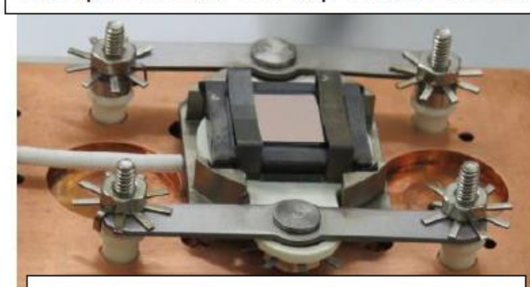


Sample size should be approximately 12mm x 15 mm



Pyrometer reads from here

Sample holder on top of the heater



Maximum temperature: 1100ºC

Corrosion studies

Corrosion can lead to failure involving personal injuries, fatalities, unscheduled shutdowns and environmental contamination

Several studies over the past 30 years have shown that the annual direct cost of corrosion to an industrial economy is approximately 3.1% of the country's Gross National Product (GNP). In the United States, this amounts to over $276 B per year. For Canada, $60 B per year.

Catalysts

Oil refinery catalytic reactor

Catalysis

Catalysts play an important part in many chemical processes. More than 85% of chemicals come from catalytic reactions.

Catalysts:

- increase the rate of reaction
- are not consumed by the reaction
- are only needed in very small amounts

In-situ and operando catalytic experiments include

- Temperature and pressure control
- Structural characterization of intermediate compounds
- Gases in/out, flow control, analysis of gases out of the catalytic reaction

In-situ catalytic experiments

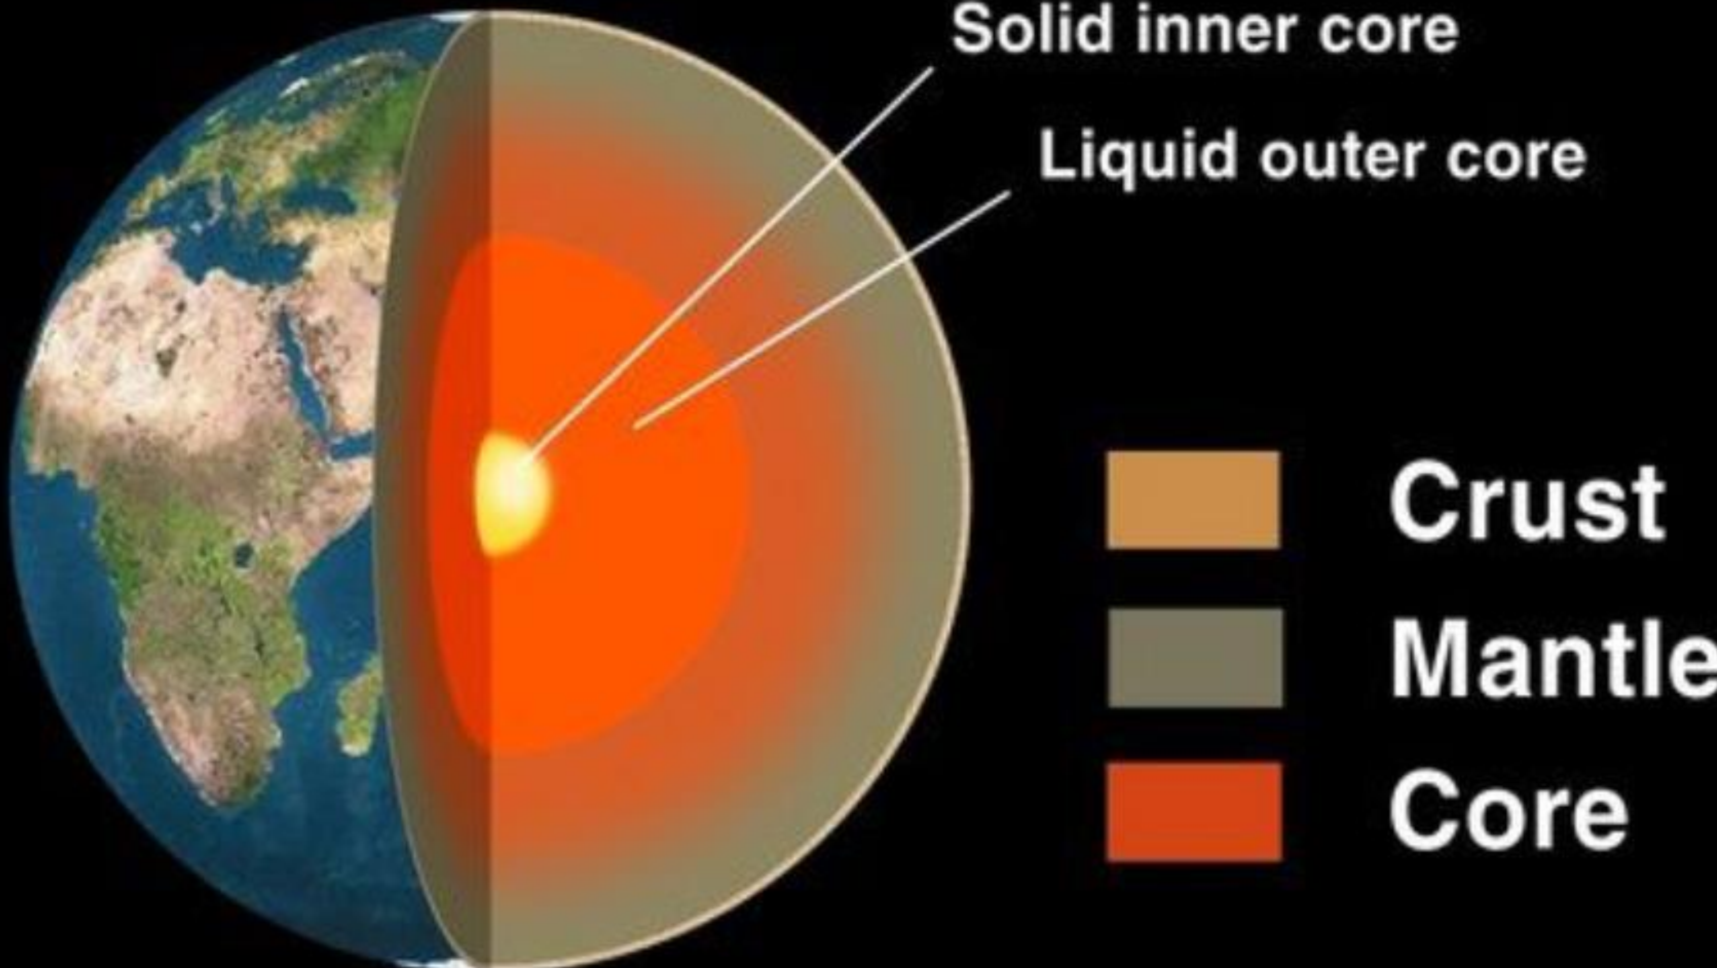
ıtsource.ca

lini et al.

Earth's core is structured in a solid inner core, mainly composed of iron, and a liquid outer core.



we conclude that the melting temperature of iron at the inner core boundary is 6230 ± 500 kelvin. This estimation favors a high heat flux at the core-mantle boundary with a possible partial melting of the mantle.

Conclusions

- In-situ experiments allow to study the materials and components under working conditions
- They yield very important information about the processes, facilitating the improvement of the materials and devices
- Many options exist both for in-house diffractometers and synchrotrons
- Synchrotrons are very flexible and well suited for in-situ experiments.

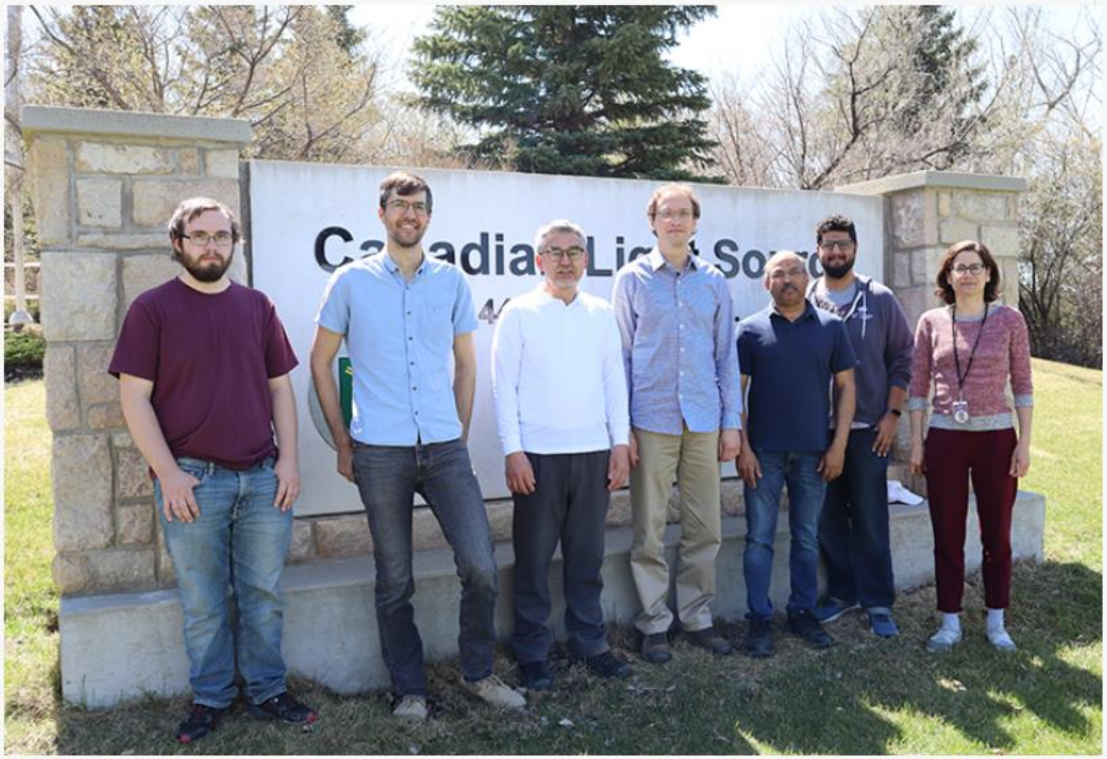
Brockhouse Diffraction Sector Beamlines

Home | Beamlines | User Guide | Contact Us | CPDW13



Welcome to the Brockhouse homepage. We provide a wide range of complementary diffraction and scattering techniques to fully characterize your materials.

- High resolution powder diffraction
- Pair distribution function (PDF)
- High energy diffraction for in-situ studies
- Reciprocal space mapping
- Small/wide angle X-ray scattering (SAXS/WAXS)
- High pressure crystallography
- X-ray reflectivity
- Grazing incidence diffraction (GID)
- Anomalous diffraction and magnetic diffraction

All 3 beamlines are now part of the general user program!
